Full-Stack Developer

Contract Type: Full Time, Permanent
Salary: £25,000 - £35,000
Additional Benefits: Shares in Dynamon; Generous pension; Epic team; Personalised benefits.
Location: Southampton Science Park, Hampshire, UK

Dynamon is looking to hire a highly driven full stack developer to bring exciting new AI products to market that will help the world's largest road transport operations eliminate their CO_2 emissions.

Dynamon is a data analytics company developing AI tools for the commercial transport industry to help fleets make smarter procurement decisions. Road transport is going through an enormous transformation with rapid developments in vehicle technology to reduce CO_2 emissions. This presents a huge challenge to commercial fleets who have processes and business models optimised for previous generation vehicle technology.

Dynamon's software tools enable fleet teams to easily identify the optimum new vehicle solutions specific to their operations to minimise both cost and environmental impact. This new disruptive approach to fleet procurement is being used by some of the largest fleets in Europe and resulting in huge cost savings and CO_2 reductions. With high demand for its services Dynamon is expanding the engineering team to boost distribution of its tools and bring new features to market.

Working closely with the software and analytics teams, you will be responsible for developing the user interface of Dynamon products to provide a seamless user experience. As a small start-up on an exponential growth trajectory, Dynamon is looking for someone who can work well within a small team and can eventually take ownership of front-end product development. Day to day work will include developing features on Dynamon products by creating an accessible front end and linking it to existing back-end systems. You will also have the opportunity to choose a software stack to create the next iteration of Dynamon products and kick start the process of turning our tools into SaaS products.

Dynamon provides an environment which enables you to do your best work and showcase your unique skillset and interests. Dynamon will support you in your career development journey through training and ownership of development projects. We have a supportive working environment and provide personalised benefits. Employee benefits include childcare vouchers, flexible working patterns, the cycle to work scheme as well as drinks delivered to your door! Company away days have included diving trips and climbing around the South coast of England. If you have any questions, please get in touch – we'll be able to sort out something!

Experience using Python or Javascript frameworks for full stack web development and UI/UX is essential. Dynamon uses Python, JavaScript, highcharts.js, D3.js, Php, PostgreSQL and AWS to deploy its products; knowledge of these languages and tools is desirable but not essential.

Please send your CV and a cover note to hello@dynamon.co.uk. We like to see evidence of your work so include links to GitHub projects. No recruiters.
